

Lecture 18

Trefoil v3: Functions

Group Work

```
| FnCall (fn_name, arg) -> (  
    match lookup fn_name env with  
    | Some (FnEntry (arg_name, body)) ->  
        let arg_value = interpret env arg in  
        let extended_env =  in  
        interpret extended_env body  
    | _ -> failwith "unbound or not a function")
```

For each of the following ways to fill in the blank above, write a Trefoil program where it does the right thing, and a Trefoil program where it does not.

1. `bind arg_name arg_value empty`
2. `bind arg_name arg_value env`
3. `empty`
4. `env`

Group Work

Write 2-3 Trefoil programs where lexical scope gives the right answer and dynamic scope gives the wrong answer
